

Navigation and Ancillary Information Facility

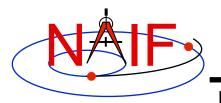

Instrument Kernel IK

April 2016

- The Instrument Kernel serves as a repository for instrument specific information useful within the SPICE context.
 - Always included:
 - » If an instrument has a field-of-view (FOV), specifications for an instrument's size, shape, and orientation
 - Other possibilities:
 - » Internal instrument timing parameters and other data relating to SPICE computations might also be placed in an I-kernel
 - » Instrument optical parameters
 - » Instrument detector geometric parameters
 - » Instrument optical distortion parameters
- Note: instrument mounting alignment data are specified in a mission's Frames Kernel (FK)

I-Kernel Structure

Navigation and Ancillary Information Facility

• An I-Kernel is a SPICE text kernel. The format and structure of a typical I-Kernel is shown below.

KPL/IK

Comments describing the keywords and values to follow, as well as any other pertinent information.

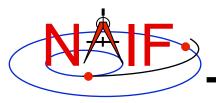

```
\begindata
  Keyword = Value(s) Assignment
  Keyword = Value(s) Assignment
```

\begintext

More descriptive comments.

```

etc...
```

I-Kernel Contents (1)

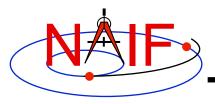

Navigation and Ancillary Information Facility

- Examples of IK keywords, with descriptions:
 - INS-94031_FOCAL_LENGTH
 - INS-41220_IFOV
 - INS-41130_NUMBER_OF_SECTORS

MGS MOC NA focal length

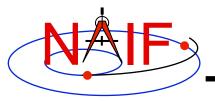

MEX HRSC SRC pixel angular size

- **MEX ASPERA NPI number of sectors**
- In general SPICE does not require any specific keywords to be present in an IK
 - One exception is a set of keywords defining an instrument's FOV, if the SPICE Toolkit's GETFOV routine is planned to be used to retrieve the FOV attributes
- The requirements on keywords in an IK are the following:
 - Keywords must begin with INS[#], where [#] is replaced with the NAIF instrument ID code (which is a negative number)
 - The total length of the keyword must be less than or equal to 32 characters
 - Keywords are case-sensitive (Keyword != KEYWORD)

I-Kernel Contents (2)

- IKs should contain extensive comments regarding:
 - Instrument overview
 - Reference source(s) for the data included in the IK
 - Names/IDs assigned to the instrument and its parts
 - Explanation of each keyword included in the file
 - Description of the FOV and detector layout
 - Where appropriate, descriptions of the algorithms in which parameters provided in the IK are used, and even fragments of source code implementing these algorithms
 - » For example optical distortion models or timing algorithms
- These comments exist primarily to assist users in integrating I-Kernel data into their applications
 - One needs to know the keyword name to get its value(s) from the IK data
 - One needs to know what each value means in order to use it properly

I-Kernel Interface Routines

Navigation and Ancillary Information Facility

• As with any SPICE kernel, an IK is loaded using FURNSH

CALL FURNSH ('ik_file_name.ti') { Better yet, use a FURNSH kernel}

 By knowing the name and type (DP, integer, or character) of a keyword of interest, the value(s) associated with that keyword can be retrieved using G*POOL routines

CALL GDPOOL (NAME, START, ROOM, <u>N, VALUES, FOUND</u>) for DP values CALL GIPOOL (NAME, START, ROOM, <u>N, VALUES, FOUND</u>) for integer values CALL GCPOOL (NAME, START, ROOM, <u>N, VALUES, FOUND</u>) for character string values

 When an instrument's FOV is defined in the IK using a special set of keywords discussed later in this tutorial, the FOV shape, reference frame, boresight vector, and boundary vectors can be retrieved by calling the GETFOV routine

CALL GETFOV (INSTID, ROOM, SHAPE, FRAME, BSIGHT, N, BOUNDS)

FORTRAN examples are shown

FOV Definition Keywords (1)

Navigation and Ancillary Information Facility

 The following keywords defining FOV attributes for the instrument with NAIF ID (#) must be present in the IK if the SPICE Toolkit's GETFOV module will be used

Keyword defining shape of the FOV

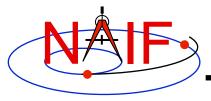

INS#_FOV_SHAPE = 'CIRCLE' or 'ELLIPSE' or 'RECTANGLE' or 'POLYGON'

 Keyword defining reference frame in which the boresight vector and FOV boundary vectors are specified

INS#_FOV_FRAME = 'frame name'

- Keyword defining the boresight vector

INS# BORESIGHT = (X, Y, Z)

FOV Definition Keywords (2)

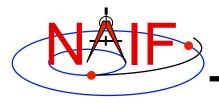

Navigation and Ancillary Information Facility

Keyword(s) defining FOV boundary vectors are provided in either of two ways

1) By specifying boundary vectors explicitly

where the FOV_BOUNDARY_CORNERS keyword provides an array of vectors that point to the "corners" of the instrument field of view.

Note: Use of the INS# FOV CLASS SPEC keyword is optional when explicit boundary vectors are provided.

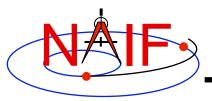

FOV Definition Keywords (3)

Navigation and Ancillary Information Facility

2) By providing half angular extents of the FOV (possible only for circular, elliptical or rectangular FOVs)

INS#_FOV_CLASS_SPEC = 'ANGLES' INS#_FOV_REF_VECTOR = (X, Y, Z) INS#_FOV_REF_ANGLE = halfangle1 INS#_FOV_CROSS_ANGLE = halfangle2 INS#_FOV_ANGLE_UNITS = 'DEGREES' or 'RADIANS' or ...

where the FOV_REF_VECTOR keyword specifies a reference vector that, together with the boresight vector, define the plane in which the half angle given in the FOV_REF_ANGLE keyword is measured. The other half angle given in the FOV_CROSS_ANGLE keyword is measured in the plane normal to this plane and containing the boresight vector.

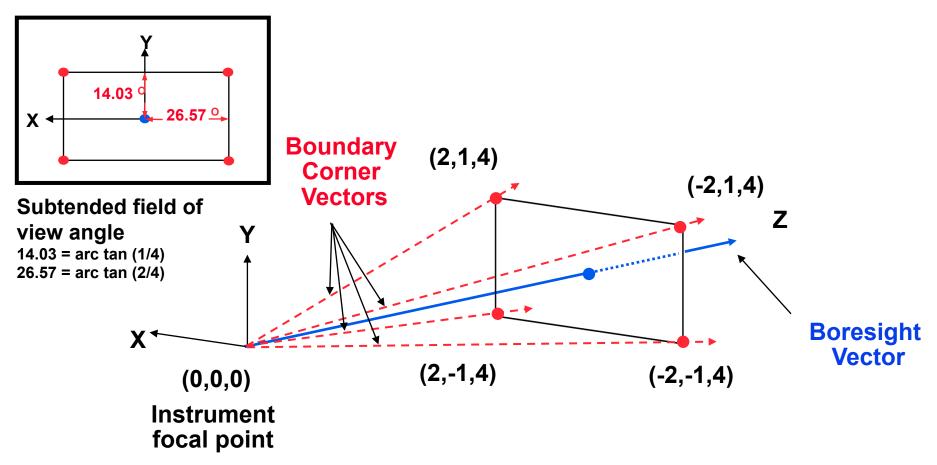

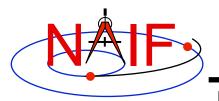

FOV Definition Keywords (4)

- When explicit boundary vectors are provided, they must be listed in either clockwise or counter-clockwise order, not randomly
- Neither the boresight nor reference vector has to be co-aligned with one of the FOV frame's axes
 - But for convenience, each is frequently defined to be along one of the FOV axes
- Neither the boresight nor corner nor reference vector has to be a unit vector
 - But these frequently are defined as unit vectors
- When a FOV is specified using the half angular extents method, the boresight and reference vectors have to be linearly independent but they don't have to be perpendicular
 - But for convenience the reference vector is usually picked to be normal to the boresight vector
- Half angular extents for a rectangular FOV specify the angles between the boresight and the FOV sides, i.e. they are for the middle of the FOV
- The next two pages show an example for a rectangular field of view

Consider an instrument with a rectangular field of view.

Rectangular FOV Definition

Navigation and Ancillary Information Facility

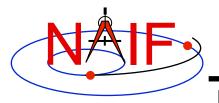

The following sets of keywords and values describe this rectangular field of view:

Specifying boundary vectors explicitly:

INS-33333_FOV_SHAPE	=	' RECTANGLE '		
INS-33333 FOV FRAME	=	'FRAME	_FOR_	INS-33333'
INS-33333 BORESIGHT	=	(0.0	0.0	1.0)
INS-33333 FOV BOUNDARY CORNERS	=	(2.0	1.0	4.0
		-2.0	1.0	4.0
		-2.0	-1.0	4.0
		2.0	-1.0	4.0)

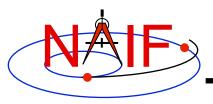

Specifying half angular extents of the FOV:

- INS-33333 FOV SHAPE INS-33333 FOV FRAME INS-33333 BORESIGHT INS-33333 FOV CLASS SPEC INS-33333 FOV REF VECTOR = $(0.0 \ 1.0 \ 0.0)$ INS-33333 FOV REF ANGLE = 14.03624347INS-33333 FOV CROSS ANGLE = 26.56505118 INS-33333 FOV ANGLE UNITS
 - = 'RECTANGLE' = 'FRAME FOR INS-33333' = (0.0 0.0 1.0)= 'ANGLES' = 'DEGREES'

IK Utility Programs

- No IK utility programs are included in the Toolkit
- Two IK utility programs are provided on the NAIF website (http://naif.jpl.nasa.gov/naif/utilities.html)
 - OPTIKS displays field-of-view summary for all FOVs defined in a collection of IK files.
 - BINGO converts IK files between UNIX and DOS text formats

Additional Information on IK

Navigation and Ancillary Information Facility

- The best way to learn more about IKs is to examine some found in the NAIF Node archives.
 - Start looking here:

http://naif.jpl.nasa.gov/naif/data_archived.html

- NAIF does not yet have an "I-Kernel Required Reading" document
- But information about IKs is available in other documents:
 - header of the GETFOV routine
 - Kernel Required Reading
 - OPTIKS User's Guide
 - Porting_kernels tutorial
 - NAIF IDs Tutorial
 - Frames Required Reading
